Background:	fibrinogen like 2(FGL2) Homo sapiens The protein encoded by this gene is a secreted protein that is similar to the beta- and gamma-chains of fibrinogen. The carboxyl-terminus of the encoded protein consists of the fibrinogen-related domains (FRED). The encoded protein forms a tetrameric complex which is stabilized by interchain disulfide bonds. This protein may play a role in physiologic functions at mucosal sites. [provided by RefSeq, Jul 2008],function:May play a role in physiologic lymphocyte functions at mucosal sites.,similarity:Contains 1 fibrinogen C-terminal domain.,subunit:Homotetramer; disulfide-linked.,tissue specificity:Constitutively expressed in cytotoxic T-cells.,
