| Background: | The protein encoded by this gene is a member of the serpin family of proteins, a group of proteins that inhibit serine proteases. This gene is one in a cluster of serpin genes located on the q arm of chromosome 14. This family member is a glycoprotein that can inhibit several serine proteases, including protein C and various plasminogen activators and kallikreins, and it thus plays diverse roles in hemostasis and thrombosis in multiple organs. [provided by RefSeq, Aug 2012],function:Inhibits activated protein C as well as plasminogen activators.,similarity:Belongs to the serpin family.,tissue specificity:Expressed by the liver and secreted in plasma., |
