Background:	ArfGAP with FG repeats 2(AGFG2) Homo sapiens This gene is a member of the HIV-1 Rev binding protein (HRB) family and encodes a protein with one Arf-GAP zinc finger domain, several phe-gly (FG) motifs, and four asn-pro-phe (NPF) motifs. This protein interacts with Eps15 homology (EH) domains and plays a role in the Rev export pathway, which mediates the nucleocytoplasmic transfer of proteins and RNAs. Alternatively spliced transcript variants have been described, but their biological validity has not been determined. [provided by RefSeq, Feb 2013],domain:Contains FG repeats and 4 N-P-F repeats.,similarity:Contains 1 Arf-GAP domain.,subunit:Interacts with EPS15R.,
