Background:	function:Transcription factor required in complex with TAF3 for the differentiation of myoblasts into myocytes. The complex replaces TFIID at specific promoters at an early stage in the differentiation process.,similarity:Belongs to the TBP family.,subcellular location:Present in the cytoplasm during cytokinesis.,subunit:Interacts with TAF3.,tissue specificity:Ubiquitously expressed in all tissues examined with highest levels in heart, lung, ovary, spleen and testes.,function:Transcription factor required in complex with TAF3 for the differentiation of myoblasts into myocytes.
