Background:	WASF4P (WAS protein family member 4, pseudogene) is a pseudogene belonging to the family of genes encoding Wiskott-Aldrich syndrome (WAS) proteins, which are involved in the transmission of signals to the actin cytoskeleton. Wiskott-Aldrich syndrome is a disease of the immune system. This pseudogene, which is apparently not transcribed, most closely resembles WASF4P encoding the WAS protein family member 2, which is located on chromosome 1.
